

In the Claims

Please amend claims 1 and 5-6 as follows:

1. (Currently Amended) A method of automatically generating a will document, comprising:

providing a user with a plurality of input screens, arranged in a sequential and logical order, wherein said screens include an initial screen ~~for~~ that requires a prefatory step of selecting between at least two levels of complexity based upon both subjective and objective criteria, wherein each of said two levels of complexity will ~~subsequently provide~~ create one or more different screens based on the level of complexity selected requiring input data comprising: personal and family information, financial information, asset information, estate distribution selections, trust parameter selection, and guardian and trustee selections; and

processing data input by an end-user to automatically create a will document.
2. (Previously Presented) The method of claim 1, further comprising selectively precluding a user from viewing a second screen subsequent to viewing a first screen until data is entered into said first screen.
3. (Currently Amended) The method of claim 1, ~~further comprising a prefatory step of selecting between a plurality of levels of complexity for said will document,~~ wherein each level of complexity requires ~~less~~ different input data from said input screens.
4. (Currently Amended) The method of claim 3~~1~~, wherein said prefatory step comprises selecting among three levels of complexity.
5. (Currently Amended) A software program for carrying out method of effecting an interactive process to create a document, wherein there are at least three levels of complexity and interaction one of which is initially selected by an end user based on subjective and objective criteria, wherein said three levels comprise:

a first level of complexity wherein a user inputs a first data set to a plurality of data input sections, and a null entry is not permitted;

a second level of less complexity than said first level wherein said software program makes assumptions based on limited data input by an end user, wherein said limited data is less data than said first data set; and

a third level of less complexity than said second level wherein said software program selects between several pre-determined outputs based upon basic data input by an end user, wherein said basic data is less data than said limited data set.

6. (Previously Presented) The software program method of claim 5 wherein the interactive process is the process of generating a will.

7. (Currently Amended) A method of effecting an interactive process for generating a will or trust document using a computing device comprising:

providing an initial data entry section wherein a user selects between two or more levels of data entry question complexity based upon both subjective and objective criteria;

providing a subsequent plurality of data entry questions which differ based upon the level of ~~data entry question~~ complexity chosen, wherein the data entry questions collect personal and financial data;

processing said data to calculate net worth and other parameters relevant to a will or trust; and

processing said data to create a printable document, that includes both data entered directly by an end user and data derived from data entered by an end user.

8. (Cancelled) The method of claim 1, further comprising selectively precluding a user from viewing a second screen subsequent to viewing a first screen until data is entered into said first screen.
9. (Currently Amended) The method of claim 7, further comprising a prefatory step of selecting between a plurality of levels of complexity for said will or trust document, wherein each level of complexity requires less input data from said input screens.
10. (Currently Amended) The method of claim 9, wherein said prefatory step comprises selecting among three levels of complexity.
